

BACKGROUND

The Pokedex App is an interactive platform allowing users to explore detailed Pokémon information. It integrates the Pokémon API for real-time data fetching, emphasizing dynamic design and user-friendly features.

PROBLEM

Pokémon data is vast and scattered across various sources.

Users need a centralized, visually appealing, and interactive platform.

Develop a centralized application for exploring Pokémon.

Implement features like modals for detailed information and search for quick access.

TECHNOLOGIES USED

- JAVASCRIPT FOR DYNAMIC CONTENT.
- BOOTSTRAP FOR RESPONSIVE UI.
- FETCH API FOR DATA INTEGRATION.

DEVELOPMENT PROCESS

Frontend

Used HTML, CSS, and Bootstrap to create a responsive and interactive interface.

API Integration

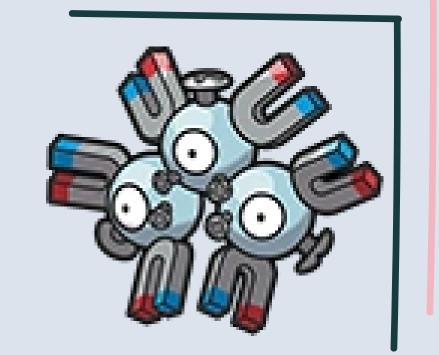

Integrated Pokémon API to fetch Pokémon data dynamically.

Techniques

- DOM manipulation for rendering Pokémon dynamically.
- Event handling for modals and search functionality.

RESULTS AND DISCUSSION

Results

- Successfully created a list of 150
 Pokémon with dynamic data fetching.
- Implemented a search bar for quick filtering of Pokémon.
- Developed modals to display Pokémon details like image, height, and type.

Discussion

- Integration with the Pokémon API worked seamlessly but required debugging for asynchronous data.
- Styling and responsiveness across devices highlighted areas for improvement.

CONCLUSION AND RECOMMENDATIONS

Conclusion

The Pokedex App successfully integrates Pokémon data into a user-friendly platform. It showcases dynamic content rendering and API integration.

Recommendations

- Add Pokémon categorization by type.
- Enable saving favorite Pokémon locally.
- Include stat comparisons for advanced user interaction.
